AI Assistance Note (Forma)

Student: Iheb Najjar | Class: DSI 31 | Workshop: Workshop 4 (Flutter & Supabase)

1. Description of AI Usage

During Workshop 4, an AI coding assistant (Antigravity by Google DeepMind) was used as a pair-programming tool for standard troubleshooting, syntax verification, and package setup. The core logic, database design, and features were implemented according to the workshop requirements.

2. Tasks the AI Assisted With

- • Package & Dependency Resolution: Resolving version constraints in pubspec.yaml when adding supabase_flutter and flutter_dotenv.
- • Asset Configuration: Explaining how to declare the .env file in pubspec.yaml assets so environment variables load cleanly.
- • PostgreSQL Security (RLS): Providing standard SQL policy syntax for Row Level Security to allow public select, insert, and delete.
- • Defensive Data Parsing: Recommending safe parsing practices for DateTime.parse() in Client.fromMap() to handle null timestamps safely.
- • Documentation Formatting: Helping organize project notes into structured Markdown documentation.

3. 5 Sample Prompts Used

1. "How do I fix missing packages in pubspec.yaml when adding supabase_flutter and flutter_dotenv?"

2. "Why does flutter_dotenv throw an asset error, and how do I declare the .env file in pubspec.yaml assets?"

3. "What is the SQL syntax for Supabase RLS policies to allow anonymous users to insert and delete tickets?"

4. "How can I safely parse created_at in Client.fromMap so it doesn't crash if the value is null?"

5. "Help me organize and format the project README documentation for my TP4 submission."
